## Abstract

Primary cardiac tumors are extremely rare. Most primary tumors are benign, and malignant tumors comprise about 15%. Angiosarcoma is the most common type of primary cardiac malignant tumors. Compared with the left atrium or ventricle, the tumor prefer to occur in the right atrium or ventricle, especially the right atrium. In this case report, we present the case of a 32-year-old female with cardiac angiosarcoma primary to the right atrial appendage (RAA).
