

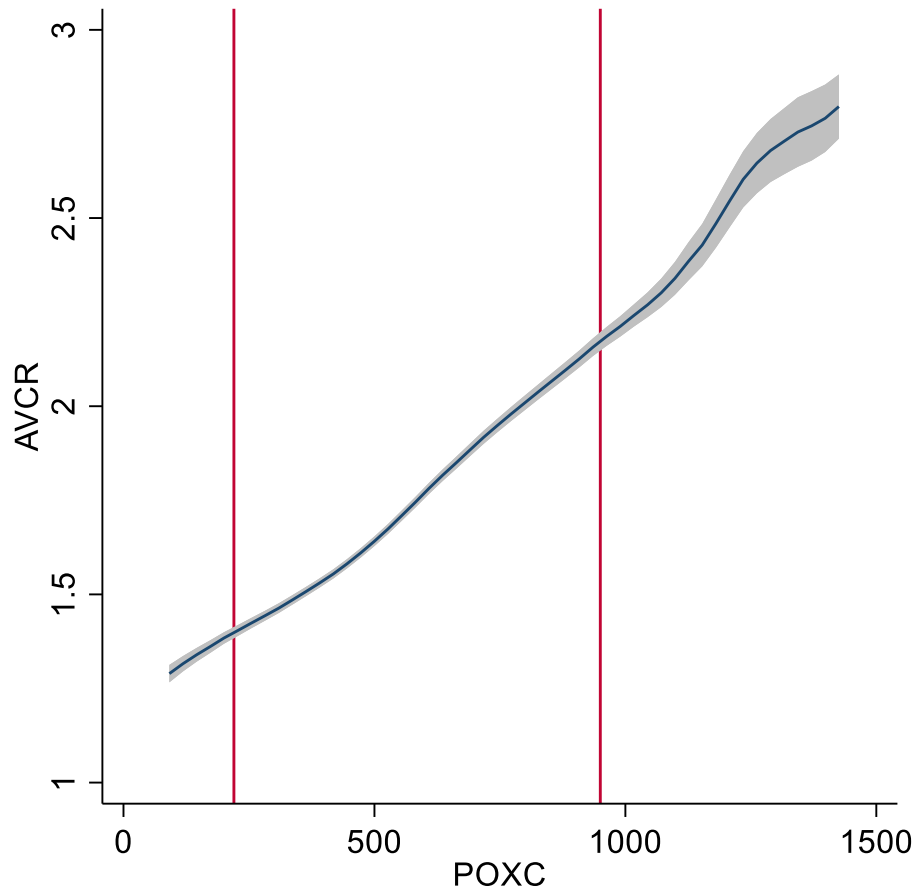

Figure 2: Estimated AVCR over distribution of active carbon in sample

Note: Vertical red lines indicate 10% and 90th percentiles of the distribution of POXC measures in the sample. AVCR estimates use AP estimates from the fixed effects model with $N \cdot POXC \cdot \log(\text{rainfall})$ interaction (column 6 in table 2), and a farmgate maize-nitrogen price ratio of 0.15.
