JAMSTEC Samples & Data

Public Distribution

JAMSTEC publicly distributes samples and data obtained by research cruises through several websites. Public users can request/download the samples and data, and utilize them for additional uses with research/educational purposes.

Websites

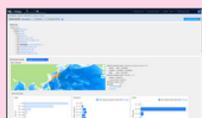

DARWIN cruise/diver data & samples

J-EDI dive video & photo

Marine biological sample database

BISMAL marine life occurrence

Core sample curation website

And more at NUUNKUI

Variety of websites are operated for distributing information to the public, reflecting the wide variations of information types and the complex workflows in behind. Related information is linked together and create a large network among these websites.

In-House Sample Management Database

JAMSTEC Sample Database (JSDB) for Rock, Sediment Core & Biological Sample Management

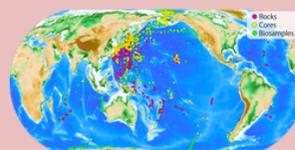

JSDB, an integrated management-level database for JAMSTEC samples was newly installed. These sample types were previously managed using separated information systems.

-System package: I.B.MUSEUM v12, (Waseda Sys. Devel. Co. Ltd.)

-Server: vCPU: 8 x 2.3GHz /MEM: 16GB /HDD: 300GB /CentOS 7.5

JSDB Sample Information

Statistics of database records (as of 01/07/2020)

Sample Type	Metadata	Physical Samples	Associated Data
Rocks	24413	13563 ¹⁾	6889
Cores ²⁾	1616	963	13343
Biosamples	60277	60276 ³⁾	-

¹⁾Includes 2813 records of duplicated samples.
²⁾Numbers refer to coring events or drilled holes.
³⁾Includes 273 records of photo-only samples.

List of sample metadata, i.e. the information of onboard sampling activities, is submitted by onboard researchers after each cruise, whereas information of archived physical samples and sample associated data, are provided at different timing by on-shore sample managers, onboard technicians or research groups. Using JSDB, operators can organize the complex relations among these records.

Development Notes

Major Features of JSDB

-Fit to multiple sample types: Data items for geological samples were re-organized to follow the IGSN metadata schema. Biological data items such as those for taxonomy were incorporated as well.

-Can handle various data formats: Electric files with any data format can be uploaded to JSDB, as associated data for samples.

-Designed for group-based sample management: Each record is secured by user group write permission, and by flag controls that allow intergroup browsing and on-line publication.

-Utilize package built-in functions: The developer package accommodates convenient user interfaces, such as input assistance, complex data search and customizable viewers.

Future Plans and Problems

-Data forwarding to public distribution systems: Implementation of data synchronization module for DARWIN is on-going. The module re-maps data items to compensate the differences in metadata schema.

-Further commitment with IGSN: Currently, limited samples have IGSNs as URL-type associated data. Major involvement with IGSN will need detailed considerations for information workflows, including ID allocation, information sharing with researchers and IGSN administration office.

-In-house collaboration: Physical samples are independently managed in multiple departments and research groups. In-house information sharing is widely operated for biological samples. Similar collaboration may help effective management of rocks and cores.
