35

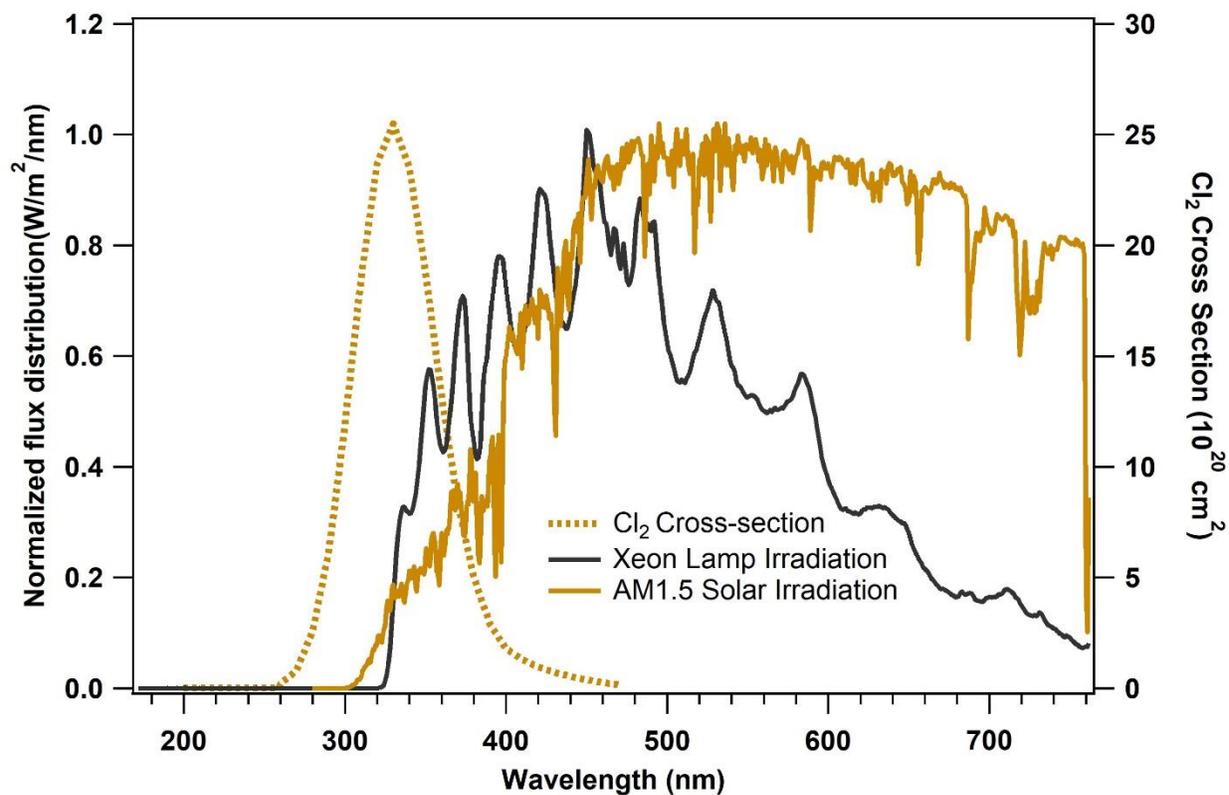

36 **Figure. S5. Scatter plot of the production rate of Cl<sub>2</sub> (P<sub>Cl<sub>2</sub></sub>) and various measured parameters**  
 37 **from 08:00 to 18:00 in the continental air mass during 5 September and 9 October 2018.** The  
 38 P<sub>Cl<sub>2</sub></sub> equals the photolysis rate of Cl<sub>2</sub> (J<sub>Cl<sub>2</sub></sub> × measured Cl<sub>2</sub> concentration), assuming Cl<sub>2</sub> in a photo  
 39 stationary state (given its short lifetime of ~7 minutes at noon in our study). J<sub>Cl<sub>2</sub></sub> was calculated  
 40 from the TUV model ([http://cprm.acom.ucar.edu/Models/TUV/Interactive\\_TUV](http://cprm.acom.ucar.edu/Models/TUV/Interactive_TUV)) under clear sky  
 41 conditions and then scaled to the solar irradiation derived J<sub>NO<sub>2</sub></sub> (see Methods section 3).

47

48 **Figure. S7. The schematic and photos of the experimental apparatus for Cl<sub>2</sub> production by**  
49 **irradiation.** The chamber is made of TFE Teflon (1.875L, 25cm-length × 15cm-width × 4cm-

50 height) with a Teflon-film window on the top.

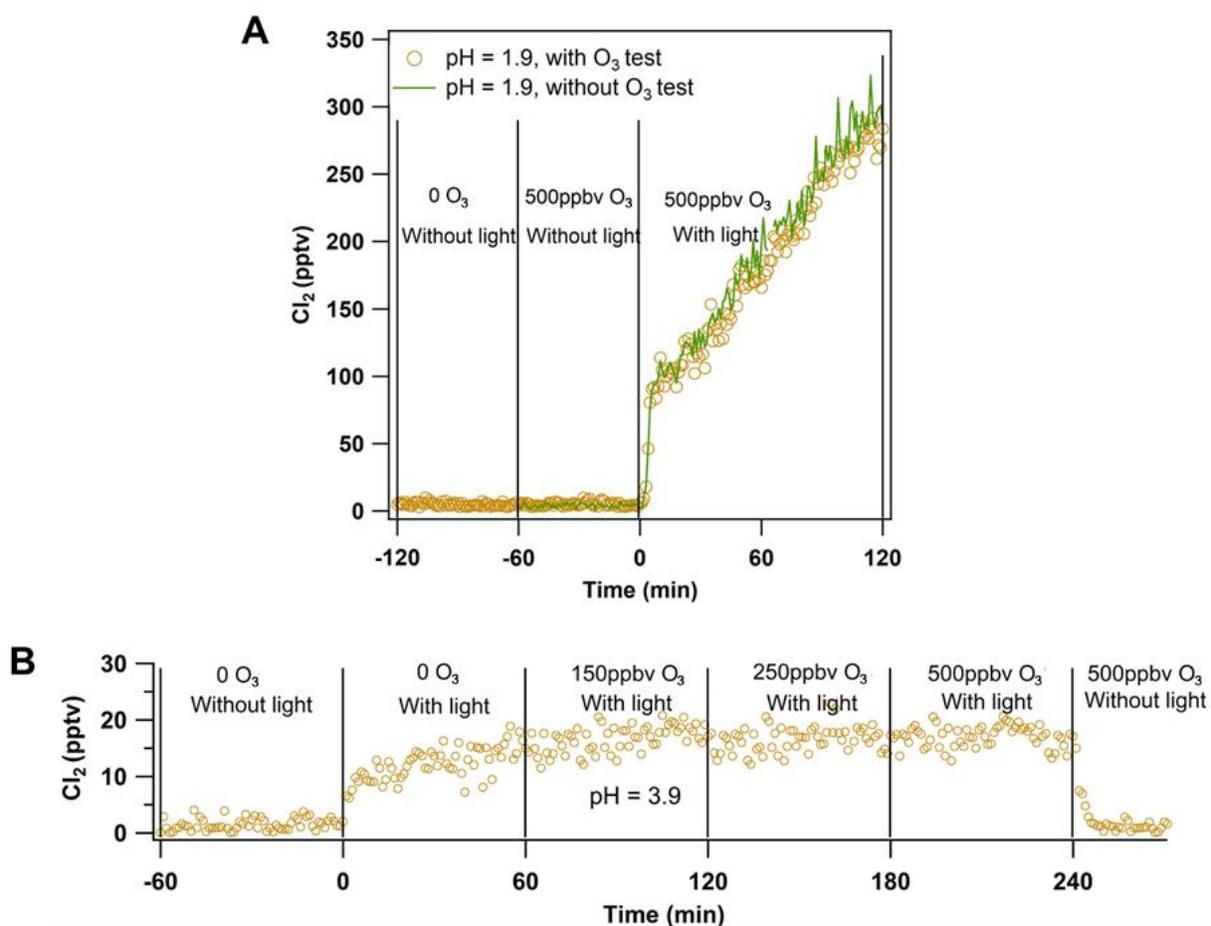

51

52

53 **Figure. S8. Ozone experiment results on solutions.** (A) Comparison of 1-min average  $\text{Cl}_2$   
 54 mixing ratios without and with ozone. Acidic liquid solution samples (pH=1.9) were illuminated  
 55 at t=0. The green line represents the result without ozone, and the orange cycle represents result  
 56 with ozone. In the ozone test, about 500 ppbv ozone was added at t= - 60 min. (B) Time series  
 57 of  $\text{Cl}_2$  mixing ratios with the addition of various levels of ozone. Liquid solution samples (pH=3.9)  
 58 were illuminated at t=0. About 150 ppbv ozone was added at t= 60 min, and the ozone level was  
 59 changed to 250 ppbv at t=120, and further changed to 500ppbv at t=180 min. The xenon lamp was  
 60 turned off at t=240 min. Experimental conditions: 75-83% RH, 298 K in air, and one 4 ml liquid  
 61 solution sample containing 1M NaCl + 1M  $\text{NaNO}_3$ .

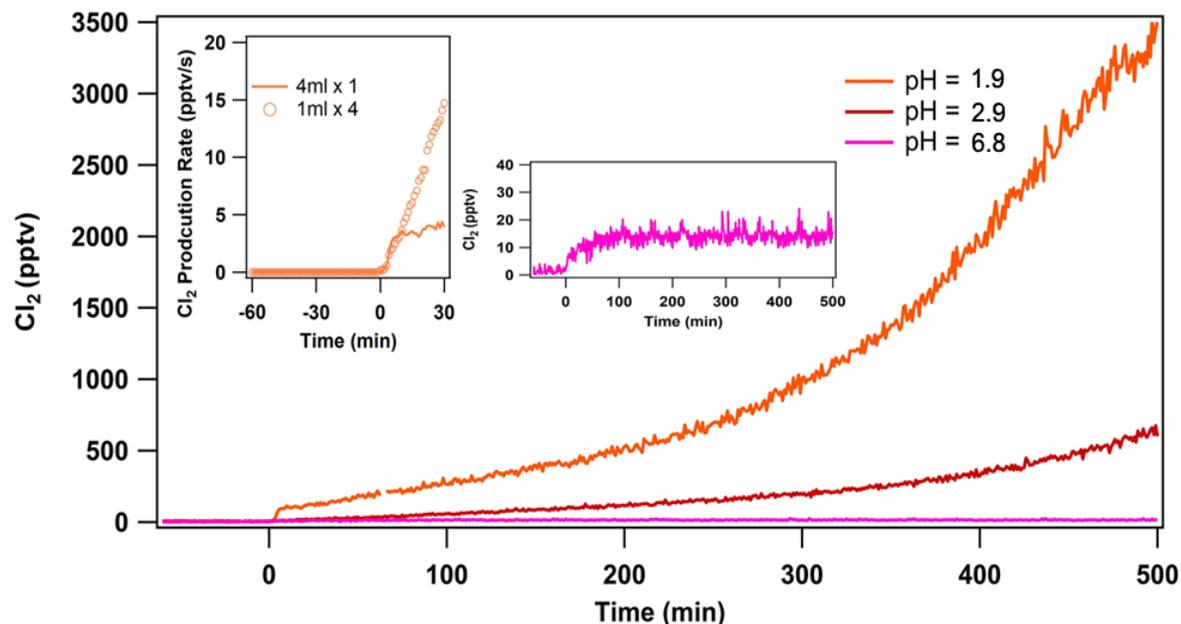

62

63

64

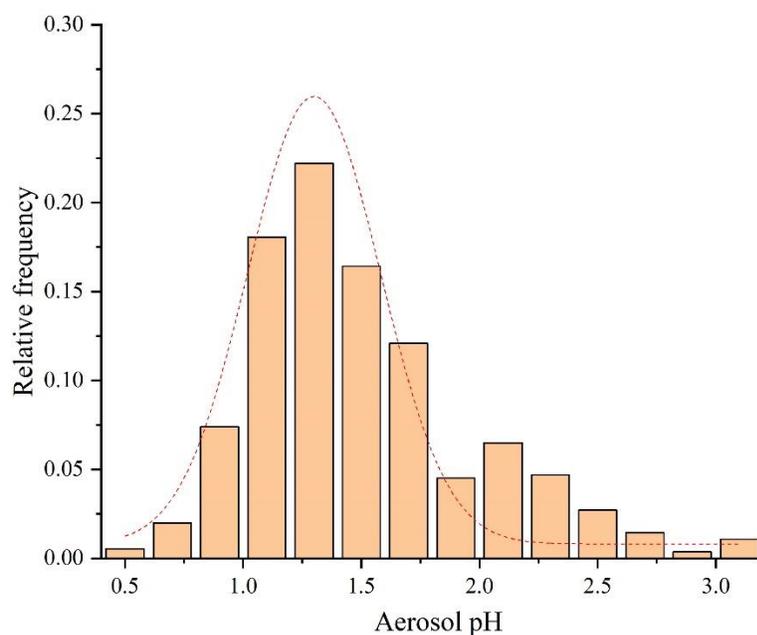

65 **Figure. S9. Experimental results on solutions with different initial pH.** Time series of 1-min  
66 average  $\text{Cl}_2$ . Liquid solution samples (with the initial pH of 1.9, 2.9, and 6.8) were illuminated  
67 at  $t=0$ . The left insert: dependence of the  $\text{Cl}_2$  yield (the production of  $\text{Cl}_2$ ) as a function of time  
68 under the initial pH= 1.9. The orange cycle represents the use of one petri dish with 4ml solution,  
69 and the orange line represents the use of four Petri dishes with 1ml solution per petri dish. The  
70 right insert: the enlarged experimental results on solutions with the initial pH of 6.8. Experimental  
71 conditions: 75-83% RH, 298 K in air, and total 4 ml liquid solution containing 1M NaCl + 1M  
72  $\text{NaNO}_3$ .

73

74

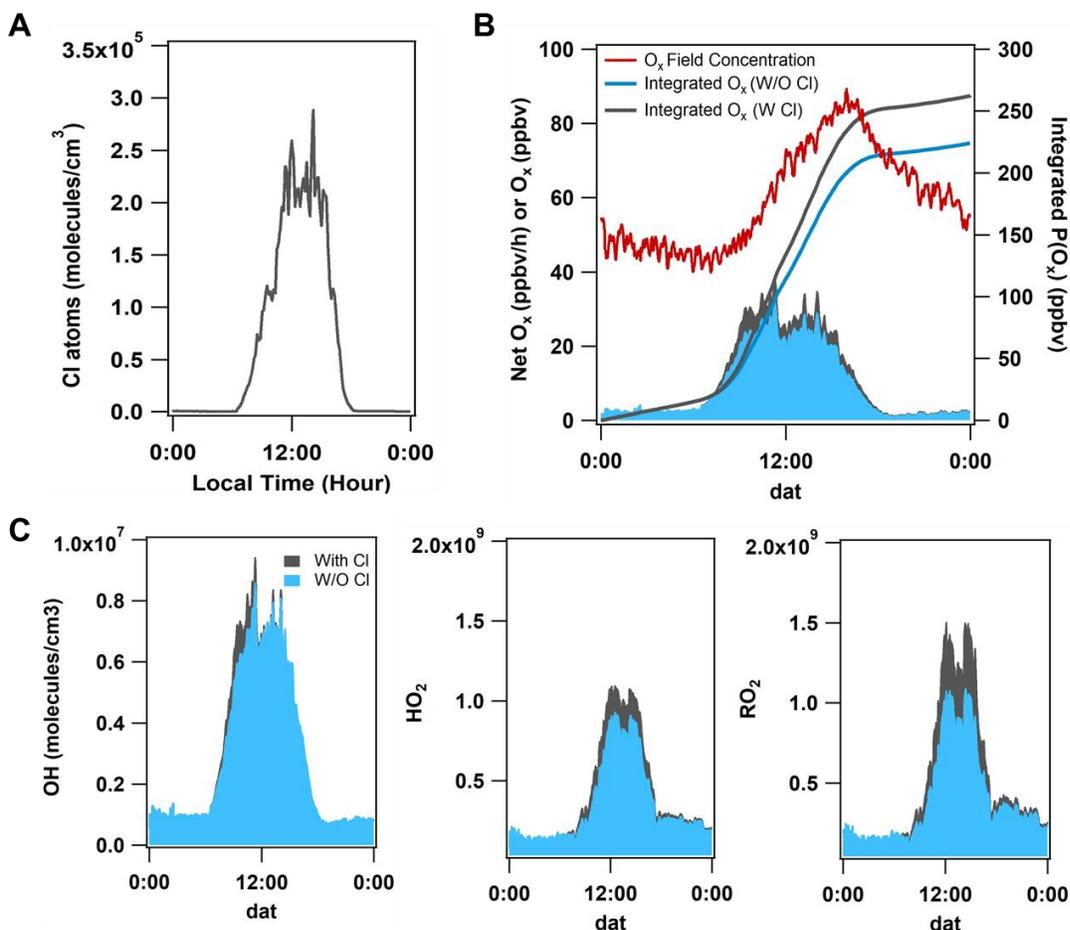

75 **Figure S10. Relative frequency distribution of E-AIM calculated pH of hourly aerosol in**  
76 **PM<sub>2.5</sub> during the Hok Tsui observation from 31 August to 9 October in 2018.** The number of  
77 data points is 555. The red dashed line represents a regression of the pH by Gaussian distributions.  
78 Details of E-AIM model setup are as follows. Model III with the batch mode was selected. The  
79 default temperature, pressure, and volume were adopted as 298.15 K, 1 atm, and 1 m<sup>3</sup>, respectively.  
80 H<sup>+</sup> was set to balance the charges of anions and cations. Br<sup>-</sup> and OH<sup>-</sup> were set as zero. Water  
81 dissociation is considered (parameter e=1). Gas-phase HNO<sub>3</sub>, HCl, NH<sub>3</sub>, and H<sub>2</sub>SO<sub>4</sub> are allowed  
82 and are partitioned between the gas phase and the condensed phases (parameter p, q, r, s = 0). The  
83 model is configured to search all the possible solids (parameter u=0). Organic compounds are not  
84 considered in the model.

85

86

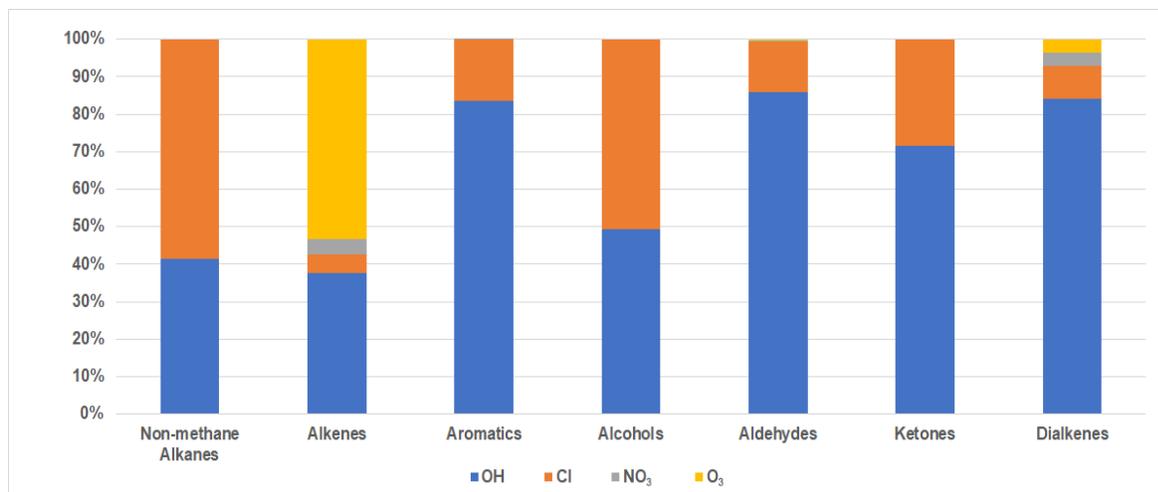

87 **Figure. S11. The model calculated contributions of net ozone production rates and radical**  
 88 **abundance averaged for the period of 4 -14 September 2018. (A)** The average diurnal profiles  
 89 of Cl atom concentrations. **(B)** The average diurnal profiles of the net production rate of  $O_x (= O_3$   
 90  $+ NO_2)$  (different color bars). The blue bar and black bar represent results without Cl chemistry  
 91 and with Cl chemistry, respectively. The red line represents field measurements of  $O_x$ . **(C)** The  
 92 average diurnal profiles of OH,  $HO_2$ , and  $RO_2$ . The blue and black bars have the same meaning  
 93 as panel (B).

94

95

96 **Figure. S12. Calculated hydrocarbon oxidation rates by different oxidants.** Relative  
97 contributions to the daily integrated oxidation of alkanes, alkenes (without dialkenes), aromatics,  
98 alcohols aldehyde, ketones, and dialkenes by OH, Cl, NO<sub>3</sub>, and O<sub>3</sub> (averaged for the time period  
99 of 4-14 September of 2018).

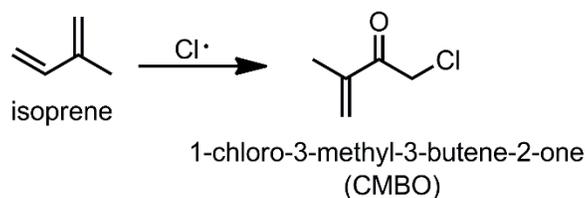

100

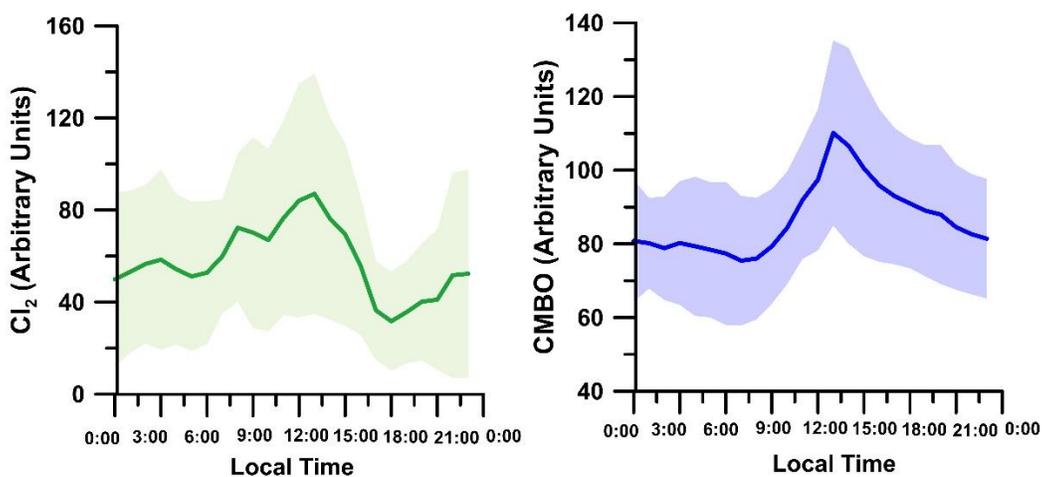

101

102 **Figure S13. Mean diurnal profile of Cl<sub>2</sub> and CMBO.** Besides the inorganic chloride species,  
103 organochlorides (ClOVOCs) were also measured at the same measurement site in Hong Kong  
104 using the High-Resolution Time of Flight Mass Spectrometer (HR-ToF-CIMS) but at different  
105 period (14-26 November 2018). We detected thirteen gas-phase C<sub>1</sub>-C<sub>6</sub> ClOVOCs with 1-chloro-  
106 3-methyl-3-butene-2-one (CMBO, C<sub>5</sub>H<sub>6</sub>ClO) as the most dominant organochloride. CMBO is the  
107 chlorine oxidation product of isoprene, which makes this ClOVOC a unique tracer of chlorine-  
108 biogenic chemistry. The daily maxima of CMBO coincided with that of Cl<sub>2</sub>, indicative of VOC  
109 oxidation by Cl atom. The color region represents the standard deviation of the data set. This will  
110 be explained further in succeeding studies. No calibration was conducted, and therefore the Cl<sub>2</sub>  
111 and CMBO measurements shown here are in arbitrary units. The detailed information of the  
112 instrument and identification of Cl-VOCs can be found in the previous study <sup>1</sup>.

113

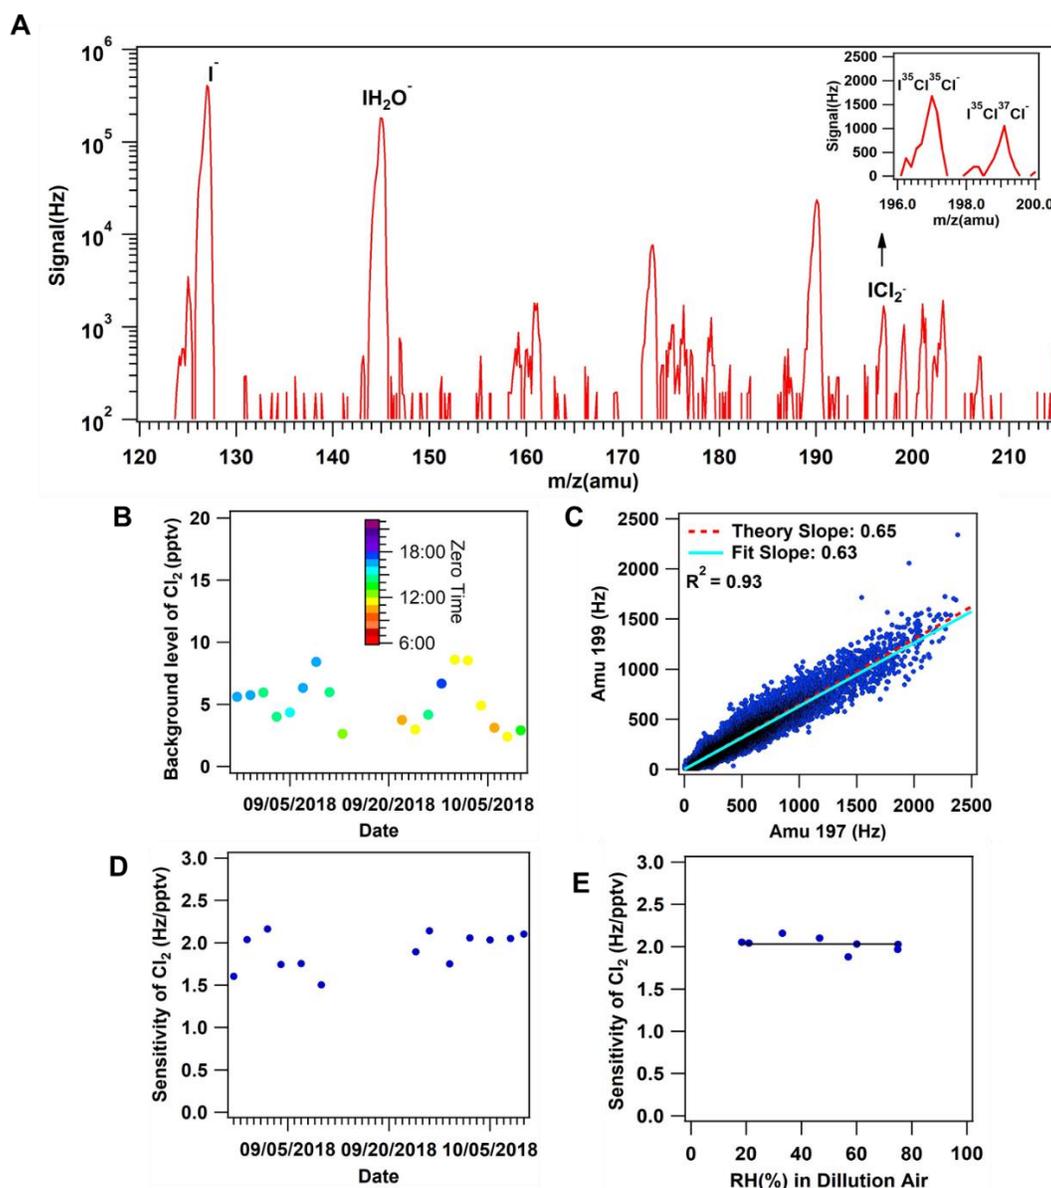

114

115

116

117 **Figure. S14. The CIMS performance for Cl<sub>2</sub> ambient measurement from 31 August to 9**  
 118 **October of 2018. (A)** An example of the mass spectrum of CIMS from 120 amu to 220 amu during  
 119 the field measurements. The signals below 10 Hz were not recorded during hourly scans but were  
 120 recorded during measurements. The insert panels are the high-resolution scan spectra for Cl<sub>2</sub>. **(B)**  
 121 The background level of Cl<sub>2</sub> (the signal equivalent to concentration) during the campaign. **(C)**  
 122 Scatter plot of the raw CIMS signal of Cl<sub>2</sub> at mass 199 amu (<sup>35</sup>Cl<sup>37</sup>Cl<sup>-</sup>; <sup>37</sup>Cl<sup>35</sup>Cl<sup>-</sup>) versus 197 amu  
 123 (<sup>35</sup>Cl<sup>35</sup>Cl<sup>-</sup>) with 10 min average for the entire ambient measurement period. The blue lines are the  
 124 measured ratios, and the red dashed lines are the theoretical isotopic ratios. **(D)** The sensitivity of  
 125 Cl<sub>2</sub> was determined on-site to confirm the stability of CIMS. **(E)** The sensitivity of Cl<sub>2</sub> under  
 126 different RH in dilution zero air.

127

128

129 **Supplementary Tables:**

130 **Table. S1: Input parameters to the box model for halogen impact evaluation.** All listed  
 131 parameters (except for CH<sub>4</sub> and HCHO) in the table were the concurrent measurement data at our  
 132 site for period 4-14 September 2018. The VOCs names are given in MCM format.

| No | Parameter              | Time resolution | Average value $\pm$<br>Standard deviation |
|----|------------------------|-----------------|---|
| 1  | Temperature            | 1 min           | 27.7 $\pm$ 1.25 °C                        |
| 2  | RH                     | 1 min           | 82.8 $\pm$ 4.42%                          |
| 3  | JNO2                   | 1 min           | 0.0021 $\pm$ 0.0026 s <sup>-1</sup>       |
| 4  | NO                     | 1 min           | 1.46 $\pm$ 0.385 ppbv                     |
| 5  | NO2                    | 1 min           | 4.45 $\pm$ 1.53 ppbv                      |
| 6  | O3                     | 1 min           | 55.4 $\pm$ 14.0 ppbv                      |
| 7  | CO                     | 1 min           | 260 $\pm$ 10.2 ppbv                       |
| 8  | SO2                    | 1 min           | 1.77 $\pm$ 0.367 ppbv                     |

140

141 \* HONO was measured by CIMS and LOPAP in this study. The two instruments showed good  
 142 agreement. The HONO data from the CIMS were used in model calculations.

143 \*\* The molar concentrations of inorganic ions (i.e., [Cl<sup>-</sup>], [NO<sub>3</sub><sup>-</sup>], and [H<sup>+</sup>]) in aerosol water were  
 144 estimated using the extended aerosol inorganics model (E-AIM, model III)<sup>2,3</sup> (please see Methods  
 145 section 2).

146 \*\*\* The dry-state particle number size distribution was measured by the WSP with a diffusion  
 147 dryer, covering the size ranging from 10 nm to 10000 nm. The ambient (wet) particle number size  
 148 distributions were calculated based on a size-resolved kappa-Köhler dependence on the relative

149 humidity<sup>4-7</sup>. The aerosol surface area density was calculated with the wet ambient particle number  
150 size distribution assuming spherical particles. In the present study, data with RH greater than 90 %  
151 were excluded due to the large uncertainty of the growth factor at very high RH.
